DETAILED ACTION

Claim Objections

Claims 5-20 are objected to under 37 CFR 1.75(c) as being in improper form because a multiple dependent claim cannot depend from any other multiple dependent claim. See MPEP § 608.01(n). Accordingly, the claims 5-20 have not been further treated on the merits.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-4 are rejected under 35 U.S.C. 102(b) as being anticipated by Okabe et al. (JP 2003-107212). A machine translation of this document is provided with this office action. A formal English translation of this document will be provided with the next office action.

Regarding claims 1 and 2, Okabe (Paragraph 23) teaches a light-diffusing sheet (optical layer 3) that comprises a binder (5) and a light-diffusing agent (6). Okabe (Paragraph 40) further teaches that a metallic-oxide film (4) can be laminated to the front face of optical layer 3. Okabe (Paragraph 11) teaches that the metallic-oxide film is an electromagnetic-wave shielding material, preferably indium tin oxide (ITO), which is excellent in conductivity and transparency. The surface resistivity of the layer is below 500 Ω/\square (Paragraph 12).

Regarding claim 3, Okabe (Paragraph 28) teaches that the light-diffusing agent is added to the binder in the ratio of 0.1 to 500 parts of light-diffusing agent to 100 parts of binder. This results in a particle loading of from 0.001 to 83 wt.%. This range fully encompasses the range of the instant claim.

Regarding claim 4, Okabe (Paragraph 23 and Figure 1) teaches that the light-diffusing agent can project from the binder. This results in fine recesses and protrusions being formed on the surface of the light-diffusing sheet.
